The US natural gas industry has dramatically changed over the last ten years. The unexpected success of unconventional gas extraction has had a profound impact on these changes. Concurrently, the global liquefied natural gas market has grown considerably. As more domestic LNG export facilities go online to meet this growing global demand, Northeast Filter will be a strategic partner to support the challenging contamination separation demands in all phases of the process from purification and liquefaction through distribution. Northeast Filter offers innovative separation, coalescing, adsorptive and extractive technologies to optimize LNG operational costs, maximized production capabilities and assure timely product delivery.
